#### **C: CAUTION**

- Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
- Remove contamination including dirt and corrosion before removal, installation or disassembly.
- Keep the disassembled parts in order and protect them from dust and dirt.
- Do not place the oil pan with its inner side facing up until it is installed, to prevent intrusion of foreign matter into the valve body.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- When disassembling the case and other light alloy parts, use a plastic hammer to force it apart. Do not pry apart with screwdrivers or other tools.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine gear oil, grease or the equivalent. Do not mix gear oil, grease, etc. of different grades or manufacturers.
- Be sure to tighten bolts and nuts to the specified torque.
- Place lifts, shop jacks or rigid racks at the specified points.
- Apply gear oil or ATF onto sliding or revolution surfaces before installation in view of components usage.
- Replace deformed or damaged snap rings with new parts.
- Before installing O-rings or oil seals, apply sufficient amount of ATF fluid to avoid damage and deformation.
- Be careful not to incorrectly install or fail to install O-rings, snap rings and other such parts.
- Before securing a part on a vise, place cushioning material such as wood blocks, aluminum plate, or cloth between the part and the vise.
- Avoid damaging the mating surface of the case.
- Before applying liquid gasket, completely remove the old seal.
- When disassembling the AT, be sure to use nylon gloves and paper towels. Do not use cloth gloves or waste cloth.

# Automatic Transmission Fluid

## AUTOMATIC TRANSMISSION

## 2. Automatic Transmission Fluid

### A: INSPECTION

#### NOTE:

The level of ATF varies with fluid temperature. Pay attention to the ATF temperature when checking ATF level.

1) Raise the ATF temperature by driving a distance of 5 to 10 km (3 to 6 miles). Otherwise, idle the engine to raise ATF temperature to 70 — 80°C (158 — 176°F) on Subaru Select Monitor. <Ref. to 4AT(diag)-16, READ CURRENT DATA, OPERATION, Subaru Select Monitor.>

2) Park the vehicle on a level surface.

3) After selecting all positions (P, R, N, D), set the select lever in “P” range. Idle the engine for 1 or 2 minutes, and measure the ATF level.

- (A) ATF level gauge
- (B) Upper level
- (C) Lower level

4) Make sure that the ATF level is between upper and lower marks of the HOT side.

If the fluid level is below the lower mark, check the transmission for leaks. If there are leaks, it is necessary to repair or replace gaskets, oil seals, plugs or other parts.

5) If the ATF level is below the center point between upper and lower level marks, add the recommended ATF until the fluid level is above the center point between the upper and lower level marks.

#### CAUTION:

- **Be careful not to exceed the upper level.**
- **If ATF is added to the upper level while the transmission is cool, there will be too much ATF and will cause problems. Do not exceed the upper level.**

6) Check ATF level after raising ATF temperature to 70 — 80°C (158 — 176°F) by running the vehicle again or by idling the engine.

### B: REPLACEMENT

- 1) Lift up the vehicle.
- 2) Remove the drain plug (ATF) and completely drain the ATF.

#### CAUTION:

**After running the engine or after idling for a long time, the ATF is hot. Be careful not to burn yourself.**

3) Check the condition of ATF. <Ref. to 4AT-29, CONDITION CHECK, Automatic Transmission Fluid.>

4) Perform replacement with a new gasket, and tighten the drain plug (ATF).

#### Tightening torque:

**25 N·m (2.5 kgf-m, 18.4 ft-lb)**

- (A) Oil pan
- (B) Drain plug (ATF)

- 5) Lower the vehicle.
- 6) Pour ATF from the oil charge pipe.

#### Recommended fluid:

**<Ref. to RM-4, FLUID, RECOMMENDED MATERIALS, Recommended Materials.>**

#### Capacity:

**Refill with the same amount of ATF drained from the drain plug hole.**

#### Capacity when transmission is overhauled:

**9.3 — 9.6 ℓ (9.8 — 10.1 US qt, 8.2 — 8.4 Imp qt)**

- 7) Bleed the air of control valve. <Ref. to 4AT-61, Air Bleeding of Control Valve.>
- 8) Check the level and leaks of ATF. <Ref. to 4AT-28, INSPECTION, Automatic Transmission Fluid.>

## C: CONDITION CHECK

**NOTE:**

When replacing ATF, check the inside condition of transmission body by inspecting the drained ATF.

Fluid condition	Trouble and possible cause	Corrective action
Large amount of metallic pieces are found.	Excessive wear of the internal of the transmission body.	Replace ATF and check if AT operates correctly.
Thick and varnish-form fluid.	Burned clutch, etc.	Replace ATF and check the AT body or vehicle for faulty.
Clouded fluid or bubbles are found in fluid.	Water mixed in fluid.	Replace ATF and check the water entering point.

# Differential Gear Oil

## AUTOMATIC TRANSMISSION

### 3. Differential Gear Oil

#### A: INSPECTION

- 1) Park the vehicle on a level surface.
- 2) Remove the oil level gauge and wipe it clean.
- 3) Reinsert the level gauge all the way. Make sure the level gauge is inserted correctly and in the proper orientation.
- 4) Remove the oil level gauge again, and check the level of differential gear oil. If the differential gear oil level is below "L" line, add oil to bring the level up to "F" line.

#### NOTE:

To prevent overfilling the differential gear oil, do not fill oil to the "F" line or more.

- (A) Oil level gauge
- (B) Upper level
- (C) Lower level

#### B: REPLACEMENT

- 1) Lift up the vehicle.
- 2) Remove the differential gear oil drain plug using TORX® bit T70, and drain the differential gear oil completely.

#### CAUTION:

- Because the differential gear will be very hot after driving, be very careful not to receive burns.

- Be careful not to spill the differential gear oil on exhaust pipe to prevent it from emitting smoke or causing fires. If differential gear oil is spilled on the exhaust pipe, wipe it off completely.

- 3) Replace the gasket with a new part and tighten the differential gear oil drain plug using the TORX® bit T70.

#### Tightening torque:

##### Aluminum gasket

44 N·m (4.5 kgf·m, 32.5 ft·lb)

##### Copper gasket

70 N·m (7.1 kgf·m, 51.6 ft·lb)

- (A) Oil pan
- (B) Differential gear oil drain plug

- 4) Lower the vehicle.
- 5) Fill the differential with differential gear oil from the level gauge hole.

#### Recommended gear oil:

<Ref. to 4AT-3, RECOMMENDED GEAR OIL, SPECIFICATION, General Description.>

#### Gear oil capacity:

1.1 — 1.3 ℓ (1.2 — 1.4 US qt, 1.0 — 1.1 Imp qt)

- 6) Check the level of differential gear oil.  
<Ref. to 4AT-30, INSPECTION, Differential Gear Oil.>

## 4. Road Test

### A: INSPECTION

#### 1. GENERAL PRECAUTION

Road tests should be conducted to properly diagnose the condition of automatic transmission.

##### NOTE:

When performing the test, do not exceed posted speed limit.

#### 2. D RANGE SHIFT FUNCTION

Check shifting between 1st ↔ 2nd ↔ 3rd ↔ 4th while driving on normal city streets.

#### 3. D RANGE SHIFT SHOCK

Check the shock level when shifting up during normal driving.

#### 4. KICK-DOWN FUNCTION

Check kick-down for each gear. Check the shock level during kick-down at the same time.

#### 5. ENGINE BRAKE OPERATION

- Check the 3rd gear engine brake when shifting down from 4th to 3rd range while driving in 4th gear of manual mode [50 — 60 km/h (31 — 37 MPH)].
- Check the 2nd gear engine brake when shifting down from 3rd to 2nd range while driving in 3rd gear of manual mode [40 — 50 km/h (25 — 31 MPH)].
- Check the 1st gear engine brake when shifting down from 2nd to 1st range while driving in 2nd gear of manual mode [20 — 30 km/h (12 — 19 MPH)].

#### 6. LOCK-UP FUNCTION

- When the accelerator is lightly depressed while driving on a flat road in “D” range, check that rpm does not change abruptly.
- Check slip lock-up with following procedure. Subaru Select Monitor is required for judgment. Before starting the check, make sure that no DTC is displayed using the Subaru Select Monitor. If there is a DTC, perform the corrective action according to the DTC. Recheck to see that the DTC has been cleared, then start the slip lock-up check. 1) The check is to be performed on a flat and straight road or on a free roller.

##### NOTE:

- Slip lock-up will not operate when the vehicle is lifted up off of its wheels, since there is no surface resistance.
- When checking on the free roller, the driving resistance will be slightly inadequate. It will be easier to judge if the foot brake is lightly applied while performing the check.

2) Connect the Subaru Select Monitor.

3) Check the ATF temperature using the Subaru Select Monitor.

##### NOTE:

- Make sure that the ATF temperature is between 50 — 100°C (122 — 212°F).
  - If the temperature is low, warm-up the ATF by running the vehicle.
- 4) Start the engine, and set so that the lock-up duty can be read on the data display of the Subaru Select Monitor.
- 5) Drive the vehicle at a constant speed of 35 — 40 km/h (22 — 25 MPH).
- 6) Read the lock-up duty while vehicle is running.

##### **Standard**

**25 — 45%**

##### NOTE:

- The reading may be slightly lower on a free roller.
- Slip lock-up control is not operating if the lock-up duty is 5% or less, or when the lock-up duty goes down immediately after starting to rise. In these cases, improper ATF or deterioration of the ATF may be the cause. Check the amount of ATF or replace the fluid, then recheck.

#### 7. P RANGE OPERATION

Stop the vehicle on an uphill grade of 5% or more and shift to the “P” range. Check that the vehicle does not move when the parking brake is released.

#### 8. NOISE AND VIBRATION

Check for noise and vibration while driving and during shifting.

#### 9. TRANSFER CLUTCH

Check for tight corner braking phenomenon when the vehicle is moved forward with the steering fully turned.

#### 10. OIL LEAKAGE

After the driving test, inspect for oil leaks.

# Stall Test

## AUTOMATIC TRANSMISSION

### 5. Stall Test

#### A: INSPECTION

**NOTE:**

The stall test is extremely important in diagnosing the condition of an automatic transmission and engine. The test is necessary to measure the engine stall speeds in “R” and “2nd of manual mode”.

Purposes of the stall test:

- Operational check of the automatic transmission clutch
- Operational check of the torque converter clutch
- Engine performance check

- 1) Check that the throttle valve fully opens.
- 2) Check that the engine oil level is correct.
- 3) Check that the coolant level is correct.
- 4) Check that the ATF level is correct.
- 5) Check that the differential gear oil level is correct.
- 6) Increase the ATF temperature to 70 to 80°C (158 to 176°F) by idling the engine for approximately 30 minutes (with select lever set to “N” or “P”).
- 7) Place the wheel chocks at the front and rear of all wheels and apply the parking brake.
- 8) Move the manual linkage to ensure it operates properly, and then set to the “2nd gear of manual mode”.

- 9) While pressing hard on the foot brake pedal, slowly depress the accelerator pedal to full throttle.
- 10) When the engine speed stabilizes, quickly record the engine speed and release accelerator pedal.

11) Shift the select lever to “N” range, and cool down the engine by idling it for one minute or more.

12) If the stall speed in “2nd gear of manual mode” is higher than specifications, low clutch slipping and 2-4 brake slipping may occur. To identify this, conduct the same test as above in “R” range.

13) Perform the stall tests with the select lever in “D” range.

**NOTE:**

- Do not continue the stall test for 5 seconds or more at a time (from closed throttle, fully open throttle to stall speed reading). Failure to follow this instruction will cause the engine oil and ATF to deteriorate and the clutch and brake to be adversely affected.
- Be sure to cool down the engine for at least one minute after each stall test with the select lever set in the “P” or “N” range and with the idle speed of 1,200 rpm or less.
- If the stall speed is higher than the specified range, attempt to finish the stall test in as short a time as possible, in order to prevent the automatic transmission from sustaining damage.

**Stall speed (at sea level):**

**2,200 — 3,000 rpm**

Stall speed (at sea level)	Range	Cause
Below specified value	2nd gear on manual mode, R	<ul style="list-style-type: none"> <li>• Throttle valve is not fully open</li> <li>• Engine malfunction</li> <li>• One-way clutch of the torque converter is slipping</li> </ul>
Over specified value	D	<ul style="list-style-type: none"> <li>• Line pressure too low</li> <li>• Low clutch slipping</li> <li>• One-way clutch malfunctioning</li> </ul>
	R	<ul style="list-style-type: none"> <li>• Line pressure too low</li> <li>• Reverse clutch slipping</li> <li>• Low &amp; reverse brake slipping</li> </ul>
	2nd gear of manual mode	<ul style="list-style-type: none"> <li>• Line pressure too low</li> <li>• Low clutch slipping</li> <li>• 2-4 brake slipping</li> </ul>

## 6. Time Lag Test

### A: INSPECTION

**NOTE:**

When the select lever is shifted while the engine is idling, there will be a certain time elapse or lag before shock is felt. This is used for checking the condition of the low clutch, reverse clutch, low & reverse brake and one-way clutch.

- Perform the test at normal operation fluid temperature of 70 — 80°C (158 — 176°F).
- Be sure to allow a one minute or more interval between tests.
- Make three measurements and take the average value.

1) Fully apply the parking brake.

2) Start the engine.

Check the idle speed (A/C OFF).

3) Shift the select lever from “N” to “D” range.

Using a stop watch, measure the time which takes from shifting the lever until the shock is felt.

Time lag: 1.2 seconds or less

If “N” → “D” time lag is longer than specified:

- Line pressure too low
- Low clutch worn
- One-way clutch not operating properly
- D-ring worn

4) In the same manner, measure the time lag of “N” → “R”.

Time lag: 1.5 seconds or less

# Line Pressure Test

## AUTOMATIC TRANSMISSION

### 7. Line Pressure Test

#### A: MEASUREMENT

##### NOTE:

If the clutch or brake shows a signs of slipping or shift feel is not correct, check the line pressure.

- Excessive shock during up-shift or if shifting takes place at a higher point than for normal conditions, this may be due to the line pressure being too high.

- Slippage or inability to operate the vehicle may, in most cases, be due to insufficient oil pressure for the operation of clutch, brake or control valve.

##### 1) Line pressure measurement (under no load):

(1) Before measuring line pressure, jack-up all the wheels.

(2) Maintain the ATF temperature at approx. 70 — 80°C (158 — 176°F) during measurement.

(ATF will reach the temperature above after idling the engine for approx. 30 minutes with the select lever in “N” or “P”.)

##### 2) Line pressure measurement (under heavy load)

(1) Before measuring line pressure, apply both the foot and parking brakes with all wheels chocked (Same as for “stall” test conditions).

(2) Measure the line pressure when the select lever is in “R” or 2nd of manual mode with engine under stall conditions.

(3) Measure the line pressure within 5 seconds after shifting the select lever to each position. (If the line pressure needs to be measured again, allow the engine to idle and cool it down for more than 1 minute.)

(4) Maintain the ATF temperature at approx. 70 — 80°C (158 — 176°F) during measurement.

(ATF will reach the above temperature after idling the engine for approx. 30 minutes with the select lever in “N” or “P”.)

##### 3) Remove the test plug and attach the ST instead.

##### 4) Connect the ST1 with ST2.

- 1) Check clearance between the snap ring and pressure plate.
- 2) Before measuring clearance, place same thickness shims on both sides to prevent the pressure plate from tilting.

3) If the clearance exceeds the service limits, replace the plate set (drive plate and driven plate), and select and adjust a retaining plate to be within the initial standard value.

**Initial standard:**

**0.7 — 1.1 mm (0.028 — 0.043 in)**

**Limit thickness:**

4) Check for tight corner braking phenomenon when the vehicle is moved forward with the steering fully turned. If tight corner braking occurs, perform the following procedures.

(1) With the steering wheel held at fully turned position, drive the vehicle in "D" range and with vehicle speed at approx. 5 km/h (3 MPH) in both clockwise and counterclockwise directions for approx. ten times each, while repeating acceleration and braking intermittently.

(2) If the tight corner braking phenomenon still persists, drive the vehicle again in a circle for several laps.

### 3. General Description

#### A: CAUTION

- **Supplemental Restraint System “Airbag”**

The airbag system wiring harness is routed near the TCM.

#### CAUTION:

- All the airbag system wiring harnesses and connectors are colored yellow. Do not use an electric test equipment to check these circuits.
- Be careful not to damage the airbag system wiring harness when performing TCM diagnostics or servicing.

- **MEASUREMENT**

When measuring the voltage and resistance of the ECM, TCM or each sensor, use a tapered pin with a diameter of less than 0.64 mm (0.025 in) in order to avoid poor contact. Do not insert a pin of more than 0.65 mm (0.026 in) diameter.

## 10.AT Oil Temp Warning Light Display

### A: OPERATION

When any on-board diagnostics item is malfunctioning, the ATF temperature warning light blinks when a malfunction is detected after starting the engine until the ignition switch is turned OFF. The malfunctioning part or unit can be determined by a DTC during the on-board diagnostics operation. Problems which occurred previously can also be identified through the memory function. If the ATF temperature warning light does not show a problem (although a problem is occurring), the problem can be determined by checking the performance characteristics of each sensor using the Subaru Select Monitor. Warning light signal patterns are shown in the figure.

#### **C: CAUTION**

- Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
- Remove contamination including dirt and corrosion before removal, installation or disassembly.
- Keep the disassembled parts in order and protect them from dust and dirt.
- Until the oil pan is removed, do not place with the oil pan side facing up to prevent foreign matter from entering the valve body.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, disassembly and replacement.
- When disassembling the case and other light alloy parts, disassemble them by slightly tapping with a plastic hammer. Do not pry apart with screwdrivers or other tools.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine gear oil, grease or the equivalent. Do not mix them of different grades or manufacturers.
- Be sure to tighten bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Apply gear oil onto sliding or revolving surfaces before installation.
- Replace deformed or damaged snap rings with new parts.
- Before installing O-rings or oil seals, apply sufficient amount of ATF fluid to avoid damage and deformation.
- Be careful not to incorrectly install or fail to install O-rings, snap rings and other such parts.
- Before securing a part on a vise, place cushioning material such as wood blocks, aluminum plate, or cloth between the part and the vise.
- Avoid damaging the mating surface of the case.
- Before applying liquid gasket, completely remove the old seal.

# Automatic Transmission Fluid

## AUTOMATIC TRANSMISSION

### 2. Automatic Transmission Fluid

#### A: INSPECTION

##### NOTE:

The level of ATF varies with fluid temperature. Pay attention to the ATF temperature when checking ATF level.

1) Raise the ATF temperature by driving a distance of 5 to 10 km (3 to 6 miles). Otherwise, idle the engine to raise ATF temperature to 70 — 80°C (158 — 176°F) displayed on Subaru Select Monitor. <Ref. to 5AT(diag)-17, READ CURRENT DATA, OPERATION, Subaru Select Monitor.>

2) Park the vehicle on a level surface.

3) After selecting all positions (P, R, N, D), set the select lever in “P” range. Idle the engine for 1 or 2 minutes, and measure the ATF level.

- (A) ATF level gauge
- (B) Upper level
- (C) Lower level

4) Make sure that the ATF level is between upper and lower marks of the HOT side.

5) If the ATF level is below the lower mark, add recommended ATF until the fluid level is between upper and lower marks.

##### CAUTION:

- Be careful not to exceed the upper level.
- When the transmission is cold, be careful not to add ATF to the upper level on HOT side. Overfilling of ATF may cause oil splashing.

6) Raise the ATF temperature by driving a distance of 5 to 10 km (3 to 6 miles). Otherwise, idle the engine to raise ATF temperature to 70 — 80°C (158 — 176°F) displayed on Subaru Select Monitor. <Ref. to 5AT(diag)-17, READ CURRENT DATA, OPERATION, Subaru Select Monitor.>

7) Check the ATF for leaks.

Visually check for leaks in the transmission. If there are leaks, replace the gasket, oil seal, plug or other parts.

#### B: REPLACEMENT

- 1) Lift up the vehicle.
- 2) Remove the ATF drain plug to drain ATF.

##### CAUTION:

**Directly after the vehicle has been running or the engine has been long idle running, the ATF is hot. Be careful not to burn yourself.**

3) Check the condition of ATF.

<Ref. to 5AT-29, CONDITION CHECK, Automatic Transmission Fluid.>

4) Tighten the ATF drain plug.

##### NOTE:

Use a new gasket.

##### Tightening torque:

**20 N·m (2.0 kgf·m, 14.8 ft·lb)**

- (A) Oil pan
- (B) ATF drain plug

5) Lower the vehicle.

6) Pour ATF from the oil charge pipe.

##### Specified fluid:

**SUBARU ATF**

##### Recommended fluid:

**IDEMITSU ATF HP**

**Castrol Transmax J**

##### NOTE:

Use of the recommended fluid is permitted only in regions where the specified fluid is not available.

##### Capacity:

**Fill with the same amount of ATF as drained.**

##### Capacity when transmission is overhauled:

**9.6 — 10.0 ℓ (10.1 — 10.6 US qt, 8.4 — 8.8 Imp qt)**

7) Check the level and leaks of ATF.

<Ref. to 5AT-28, INSPECTION, Automatic Transmission Fluid.>

## C: CONDITION CHECK

**NOTE:**

When replacing ATF, check the inside condition of transmission body by inspecting the drained ATF.

Fluid condition	Trouble and possible cause	Corrective action
Large amount of metallic pieces are found.	Internal metal parts of transmission body are excessively worn.	Replace ATF and check if AT operates correctly.
Is thick and is a varnish-form fluid.	Clutch etc. is burned.	Replace ATF and check the AT body or vehicle for faulty.
Clouded fluid or bubbles are found in fluid.	Water is mixed.	Replace ATF and check the water entering point.

# Differential Gear Oil

## AUTOMATIC TRANSMISSION

### 3. Differential Gear Oil

#### A: INSPECTION

- 1) Park the vehicle on a level surface.
- 2) Remove the collector cover.
- 3) Remove the oil level gauge and wipe it clean.
- 4) Reinsert the level gauge all the way. Make sure the level gauge is inserted correctly and in the proper orientation.
- 5) Remove the oil level gauge again, and check the level of differential gear oil. If the differential gear oil level is below "L" line, add oil to bring the level up to "F" line.

#### NOTE:

To prevent overfilling the differential gear oil, do not add oil above the "F" line.

- (A) Upper level  
(B) Lower level

#### B: REPLACEMENT

- 1) Lift up the vehicle.
- 2) Remove the differential gear oil drain plug using TORX® BIT T70, and then drain differential gear oil.

#### CAUTION:

• Immediately after the vehicle has been running or after idling for a long time, the differential gear oil will be hot. Be careful not to burn yourself.

• Be careful not to spill differential gear oil on the exhaust pipe to prevent it from emitting smoke or causing a fire. If differential gear oil is spilled on the exhaust pipe, wipe it off completely.

- 3) Tighten the differential gear oil drain plug using TORX® BIT T70.

#### NOTE:

Use a new gasket.

#### Tightening torque:

**70 N·m (7.1 kgf-m, 51.6 ft-lb)**

- (A) Oil pan  
(B) Differential gear oil drain plug

- 4) Lower the vehicle.
- 5) Pour gear oil into the gauge hole.

#### Recommended gear oil:

**<Ref. to 5AT-3, RECOMMENDED GEAR OIL, SPECIFICATION, General Description.>**

#### Gear oil capacity:

**1.3 — 1.5 ℓ (1.4 — 1.6 US qt, 1.1 — 1.3 Imp qt)**

- 6) Check the level of differential gear oil.  
<Ref. to 5AT-30, INSPECTION, Differential Gear Oil.>

## 4. Road Test

### A: INSPECTION

#### 1. GENERAL PRECAUTION

Road tests should be conducted to properly diagnose the condition of automatic transmission.

#### NOTE:

When performing the test, do not exceed posted speed limit.

#### 2. D RANGE SHIFT FUNCTION

Check shifting between 1st ↔ 2nd ↔ 3rd ↔ 4th ↔ 5th while driving on normal city streets.

#### 3. D RANGE SHIFT SHOCK

Check the shock level when shifting up during normal driving.

#### 4. KICK-DOWN FUNCTION

Check kick-down for each gear. Check the shock level during kick-down at the same time.

#### 5. ENGINE BRAKE OPERATION

- Check the 4th gear engine brake by shifting down from 5th to 4th range while driving in 5th gear of manual mode [50 — 60 km/h (31 — 37 MPH)].
- Check the 3rd gear engine brake by shifting down from 4th to 3rd range while driving in 4th gear of manual mode [50 — 60 km/h (31 — 37 MPH)].
- Check the 2nd gear engine brake by shifting down from 3rd to 2nd range while driving in 3rd gear of manual mode [40 — 50 km/h (25 — 31 MPH)].
- Check the 1st gear engine brake by shifting down from 2nd to 1st range while driving in 2nd gear of manual mode [20 — 30 km/h (12 — 19 MPH)].

#### 6. LOCK-UP FUNCTION

When the accelerator is lightly depressed while driving on a flat road in lock-up range, check that rpm does not change abruptly.

#### 7. P RANGE OPERATION

Stop the vehicle on an uphill grade of 5% or more and shift to the “P” range. Check that the vehicle does not move when the parking brake is released.

#### 8. NOISE AND VIBRATION

Check for noise and vibration while driving and during shifting.

#### 9. OIL LEAKAGE

After the driving test, inspect for oil leaks from the transmission body.

# Stall Test

## AUTOMATIC TRANSMISSION

### 5. Stall Test

#### A: INSPECTION

**NOTE:**

The stall test is extremely important in diagnosing the condition of an automatic transmission and engine. It should be conducted to measure the engine stall speeds in “2nd of manual mode”.

Purposes of the stall test:

- Operational check of the automatic transmission clutch
  - Operational check of the torque converter clutch
  - Engine performance check
- 1) Check that the throttle valve fully opens.
  - 2) Check that the engine oil level is correct.
  - 3) Check that the coolant level is correct.
  - 4) Check that the ATF level is correct.
  - 5) Check that the differential gear oil level is correct.
  - 6) Raise the ATF temperature to 70 to 80°C (158 to 176°F) by driving a distance of 5 to 10 km (3 to 6 miles). Confirm the ATF temperature on Subaru Select Monitor. <Ref. to 5AT(diag)-17, READ CURRENT DATA, OPERATION, Subaru Select Monitor.>
  - 7) Place the wheel chocks at the front and rear of all wheels and apply the parking brake.
  - 8) Move the manual linkage to ensure it operates properly, then set to “2nd gear of manual mode”.
  - 9) While stepping hard on the brake pedal, gradually step on the accelerator pedal.
  - 10) When the engine speed is stabilized, quickly record the engine speed and release accelerator pedal.

11) Shift the select lever to “N” range, and cool down the engine by idling it for one minute or more.

**NOTE:**

- Do not continue the stall test for five seconds or more at a time (from fully closed throttle to fully open throttle until stall speed reading). Doing so will make the engine oil and ATF deteriorate and the clutch and brake to be adversely affected.
  - After performing the stall test, be sure to cool down the engine for at least one minute with the select lever set in “P” or “N” range, and at an idle speed of 1,200 rpm or less.
  - If the stall speed is higher than the specified range, attempt to finish the stall test in as short a time as possible, in order to prevent the automatic transmission from sustaining damage.
  - Perform the stall test in S mode.
  - When depressing the accelerator pedal again after performing the stall test for five seconds or more, the electronic throttle control remains closed for approx. 60 seconds.
  - When the stall test is performed for 15 seconds or more continuously, the test is completed forcibly to protect the transmission unit.
- When depressing the accelerator pedal again, the electronic throttle control remains closed for approx. 60 seconds.

**Stall speed (at sea level):**

**Turbo model**

**2,300 — 3,200 rpm**

**Non-turbo model**

**1,900 — 2,200 rpm**

Stall speed (at sea level)	Range	Possible faulty parts
Over specified value	2nd gear of manual mode	<ul style="list-style-type: none"> <li>• Line pressure too low</li> <li>• Forward brake</li> <li>• Direct clutch</li> <li>• 3rd one-way clutch</li> </ul>

## 6. Time Lag Test

### A: INSPECTION

#### NOTE:

When the select lever is shifted while the engine is idling, there will be a certain time elapse or lag before shock is felt. Using this, check the condition of forward brake, reverse brake, 1st one-way clutch and 3rd one-way clutch.

- Perform the test at normal operation fluid temperature of 70 — 80°C (158 — 176°F).
- Be sure to allow one minute or more interval between tests.
- Make three measurements and take the average value.

1) Fully apply the parking brake.

2) Start the engine.

Check the idle speed (A/C OFF).

3) Shift the select lever from “N” to “D” range. Using a stop watch, measure the time-lag from shifting the lever until the shock is felt.

#### ***Time-lag***

##### ***Specification: 1.2 seconds or less***

If “N” → “D” time-lag is longer than specification:

- Line pressure too low
- Forward brake worn
- One-way clutch not operating properly

4) In the same manner, measure the time lag of “N” → “R”.

#### ***Time-lag***

##### ***Specification: 1.5 seconds or less***

If “N” → “R” time lag is longer than specification:

- Line pressure too low
- Reverse brake worn

### 7. Line Pressure Test

#### A: MEASUREMENT

##### NOTE:

If the clutch or brake shows a sign of slippage, or shifting interval is not correct, check the line pressure.

- Excessive shock during up-shift may be due to the line pressure being too high.
- Slippage or inability to operate the vehicle may, in most cases, be due to loss of oil pressure for the operation of clutch, brake or control valve.

1) Set the vehicle on a lift.

2) Remove the under cover.

3) Remove the test plug and attach the ST.

ST 498897200 OIL PRESSURE ADAPTER

4) Set the ST1 and ST2.

ST1 498897200 OIL PRESSURE ADAPTER

ST2 498575400 OIL PRESSURE GAUGE  
ASSY

5) Lower the vehicle, and pull ST1 and ST2 into the vehicle.

ST1 498897200 OIL PRESSURE ADAPTER

ST2 498575400 OIL PRESSURE GAUGE  
ASSY

6) Connect the Subaru Select Monitor to the data link connector and read the current data. <Ref. to 5AT(diag)-17, READ CURRENT DATA, OPERATION, Subaru Select Monitor.>

# Line Pressure Test

AUTOMATIC TRANSMISSION

7) Perform the line pressure test.

**NOTE:**

- Do not perform the line pressure test for 5 seconds or more at a time. Doing so will make the engine oil and ATF deteriorate and the clutch and brake to be adversely affected.
- After performing the line pressure test, be sure to cool down the engine for at least one minute with the select lever set in “P” or “N” range and with the idle speed at 1,200 rpm or less.
- Fully open or fully close the throttle valve angle in order to match the “P/L Solenoid Pressure” displayed on the Subaru Select Monitor.

Range of the selector lever	Throttle valve angle	ATF temperature condition	“P/L Solenoid Pressure” displayed on the Subaru Select Monitor kPa	Standard line pressure kPa (kg/cm <sup>2</sup> , psi)
2nd gear of manual mode	Full closed	45 — 55°C (113 — 131°F)	500 — 700	Target pressure -10 — +190 (Target pressure -0.10 — +1.94, Target pressure -1.45 — +27.5)
	Full open		2,150	1,320 — 1,520 (13.46 — 15.50, 191.4 — 220.4)
R	Full closed		2,150	1,660 — 1,860 (16.93 — 18.97, 240.7 — 269.7)

8) Remove the ST and install the test plug.

**Tightening torque:**

**13 N·m (1.3 kgf·m, 9.6 ft·lb)**

# Transfer Clutch Pressure Test

AUTOMATIC TRANSMISSION

---

## 8. Transfer Clutch Pressure Test

### A: INSPECTION

- 1) Lift up the vehicle.
- 2) Remove the bolts holding the heat shield cover, and move the heat shield cover to the rear.
- 3) Remove the test plug and attach the ST.

- Inspect the planetary carrier body for damage or breakage.

#### 2. INPUT CLUTCH

- Check the clearance of the input clutch. Measure the clearance "L" between snap ring and retaining plate using a thickness gauge. If it is out of specification, replace the entire direct clutch assembly.
- Check for damage on the drive plate, driven plate and snap ring, and replace the entire input clutch assembly if damaged.

### F: ADJUSTMENT

1) Using the ST, measure the height “A” from the AT main case mating surface to convex surface of oil pump cover.

ST 499575400 GAUGE

A Measured value

2) Using the ST, measure the depth “B” from the convex surface of oil pump cover to thrust bearing transferring surface.

ST 499575400 GAUGE

B Measured value

3) Calculate the measured value from step 1) and 2), and then set the calculated value as “C”

Calculation formula:  $C = A - B$

4) Using the ST, measure the depth “D” from the AT main case mating surface to thrust bearing transferring surface of front sun gear.

ST 499575400 GAUGE

D Measured value

5) Set the value as “E” which subtract the thickness of ST (GAUGE) from the measured value on step 4).

Calculation:  $E \text{ (mm)} = D - 15$

$[E \text{ (in)} = D - 0.59]$

6) Calculation formula:

Select one thrust bearing from the table to adjust clearance within 0.25 — 0.55 mm (0.0098 — 0.022 in).

When clearances are 0.25 mm (0.0098 in):

$T \text{ (mm)} = E - C + 0.03$

$[T \text{ (in)} = E - C + 0.0012]$

When clearances are 0.55 mm (0.022 in):

$T \text{ (mm)} = E - C + 0.27$

$[T \text{ (in)} = E - C + 0.012]$

T: Thrust bearing thickness

C: Distance from oil pump cover mating surface to rear end of oil pump cover

E: Depth from mating surface of AT main case to bearing surface of front sun gear

NOTE:

Calculation formula for “T” above is applied when measuring with the ST (499575400 GAUGE). In the calculation without using ST, substitute the thickness of collar used to calculate the value “E” on step 5).

AUTOMATIC TRANSMISSION (DIAGNOSTICS)

## 11.AT Oil Temp Warning Light Display

### A: OPERATION

When any on-board diagnostics item is malfunctioning, the AT OIL TEMP light blinks from the time the malfunction is detected after starting the engine until the ignition switch is turned OFF. The malfunctioning part or unit can be determined by a DTC during the on-board diagnostics operation. Problems which occurred previously can also be identified through the memory function. If the AT OIL TEMP light does not show a problem (although a problem is occurring), the problem can be determined by checking the performance characteristics of each sensor using Subaru Select Monitor. Indicator light signal patterns are as shown in the figure.

When the AT OIL TEMP light does not operate normally but no DTC is stored, perform the AT OIL TEMP light inspection. <Ref. to 5AT(diag)-26, INSPECTION, AT Oil Temp Warning Light Display.>

	Step	Check	Yes	No
1	<b>CHECK BODY INTEGRATED UNIT.</b> Check DTC of the body integrated unit.	Is DTC of AT CAN communication circuit displayed?	Perform the diagnosis according to DTC.	Go to step 2.
2	<b>CHECK TCM.</b> Check DTC of TCM.	Is DTC of AT CAN communication circuit displayed?	Perform the diagnosis according to DTC.	Go to step 3.
3	<b>CHECK TCM.</b> 1) Turn the ignition switch to OFF. 2) Connect the Subaru Select Monitor to the data link connector. 3) Turn the ignition switch to ON. (engine OFF) 4) Turn the Subaru Select Monitor switch to ON. 5) Shift the AT select lever to manual mode side, and shift down the AT select lever. 6) Read the indicator.	Is the gear position at 1 and "▲" displayed?	Go to step 4.	Replace the TCM. <Ref. to 5AT-59, Transmission Control Module (TCM).>
4	<b>CHECK TCM.</b> 1) Shift up the AT select lever. 2) Read the indicator.	Is the gear position at 2 and "▼" displayed?	Go to step 5.	Replace the TCM. <Ref. to 5AT-59, Transmission Control Module (TCM).>
5	<b>CHECK BODY INTEGRATED UNIT.</b> Read the gear position data using Subaru Select Monitor.	Is the SPORT shift gear position 2?	Go to step 6.	Check the body integrated unit. <Ref. to SL-55, Body Integrated Unit.>
6	<b>CHECK COMBINATION METER.</b>	Is the SPORT shift indicator OK?	Refer to "Symptom Related Diagnostic". <Ref. to 5AT(diag)-112, General Diagnostic Table.>	Replace the combination meter assembly. <Ref. to IDI-19, Combination Meter.>

### **C: CAUTION**

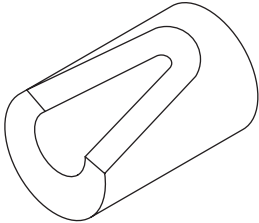

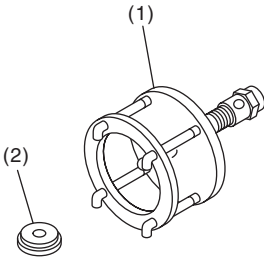

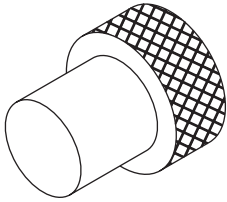

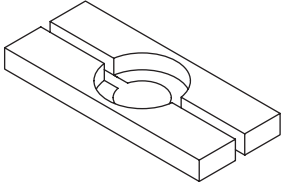

- Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
- Remove contamination including dirt and corrosion before removal, installation or disassembly.
- Keep the disassembled parts in order and protect them from dust and dirt.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- When disassembling the case and other light alloy parts, use a plastic hammer to force it apart. Do not pry apart with screwdrivers or other tools.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine gear oil, grease or the equivalent. Do not mix gear oil, grease, etc. of different grades or manufacturers.
- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Apply gear oil onto sliding or revolving surfaces before installation.
- Replace deformed or damaged snap rings with new parts.
- Before installing O-rings or oil seals, apply sufficient amount of gear oil to avoid damage and deformation.

# Transmission Gear Oil

MANUAL TRANSMISSION AND DIFFERENTIAL

## 2. Transmission Gear Oil

### A: INSPECTION

- 1) Park the vehicle on a level surface.
- 2) Turn the ignition switch to OFF, and wait until the engine cools.
- 3) Remove the oil level gauge and wipe it clean.
- 4) Reinsert the oil level gauge all the way. Be sure that the oil level gauge is correctly inserted in the proper direction.
- 5) Pull out the oil level gauge again, and check the oil level. If it is at the lower level or less, add oil through the oil level gauge hole to bring the level up to the upper level.

- (A) Oil level gauge
- (B) Upper level
- (C) Lower level

### B: REPLACEMENT

- 1) Pull out the oil level gauge.
- 2) Lift up the vehicle.
- 3) Using the TORX<sup>®</sup> BIT T70, remove the drain plug, and drain the transmission gear oil completely.

#### CAUTION:

- Immediately after the engine has been running, the transmission gear oil is hot. Be careful not to burn yourself.

- Be careful not to spill the transmission gear oil on the exhaust pipe, to prevent emission of smoke or causing a fire. If differential gear oil is spilled on the exhaust pipe, wipe it off completely.

- 4) Using the TORX<sup>®</sup> BIT T70, tighten the transmission gear oil drain plug.

#### NOTE:

- 6) Pour gear oil through the oil level gauge hole.

#### Recommended gear oil:

**GL-5 (75W-90) or equivalent**

#### Gear oil capacity:

**3.5 ℓ (3.7 US qt, 3.1 Imp qt)**

- 7) Measure the transmission gear oil level to check that it is within specifications.

#### CAUTION:

When inserting the oil level gauge into transmission, align the protrusion on the top part of the oil level gauge with the notch in the oil level gauge hole.

# General Diagnostic Table

MANUAL TRANSMISSION AND DIFFERENTIAL

## 20. General Diagnostic Table

### A: INSPECTION

#### 1. MANUAL TRANSMISSION

Symptom	Possible cause	Corrective action
1. Gears are difficult to intermesh. <b>NOTE:</b> The cause for difficulty in shifting gears can be classified into two kinds: One is a defective gear shift system and the other is defective transmission. However, if the operation is heavy and engagement of the gears is difficult, a defective clutch disengagement may also be responsible. Check whether the clutch is correctly functioning, before checking the gear shift system and transmission.	(a) Worn, damaged or burred chamfer at internal spline of the sleeve and reverse driven gear	Replace.
	(b) Worn, damaged or burred chamfer of gear spline	Replace.
	(c) Worn or scratched bushings	Replace.
	(d) Incorrect contact or wear between synchronizer ring and gear cone	Correct or replace.
2. Gear slip-out <ul style="list-style-type: none"> <li>• Gear slips out when coasting on rough road.</li> <li>• Gear slips out during acceleration.</li> </ul>	(a) Defective pitching stopper adjustment	Adjust.
	(b) Loose engine mounting bolts	Tighten or replace.
	(c) Worn fork shifter, broken shifter fork rail spring	Replace.
	(d) Worn or damaged ball bearing	Replace.
	(e) Excessive clearance between splines of synchronizer hub and synchronizer sleeve	Replace.
	(f) Worn tooth step of synchronizer hub (caused by slip-out of 3rd gear)	Replace.
	(g) Worn 1st driven gear and driven shaft	Replace.
	(h) Worn 2nd driven gear and bushing	Replace.
	(i) Worn 3rd drive gear and needle bearing	Replace.
	(j) Worn 4th drive gear and needle bearing	Replace.
	(k) Worn reverse idler gear and bushing	Replace.
3. Noise emitted from transmission <b>NOTE:</b> If a noise is heard when the vehicle is parked with its engine idling and if a noise ceases when the clutch is disengaged, it may be considered that the noise is coming from the transmission.	(a) Insufficient or improper lubrication	Lubricate with specified oil or replace.
	(b) Worn or damaged gears and bearings <b>NOTE:</b> If the trouble is only wear of the tooth surfaces, merely a high roaring noise will occur at high speeds, but if any part is broken, rhythmical knocking sound will be heard even at low speeds.	Replace.

# General Diagnostic Table

## MANUAL TRANSMISSION AND DIFFERENTIAL

### 2. DIFFERENTIAL

Symptoms	Possible cause	Corrective action
<p>1. Broken differential (case, gear, bearing, etc.)</p> <p>NOTE: Noise will occur, and eventually the differential will not be able to operate due to broken pieces obstructing the gear revolution.</p>	(a) Insufficient or improper oil	Disassemble the differential and replace broken components. At the same time check other components for any trouble, and replace if necessary.
	(b) Use of vehicle under severe conditions such as excessive load and improper use of the clutch	Readjust the preload and backlash of the bearing, and the contact surface of gear.
	(c) Improper adjustment of taper roller bearing	Adjust.
	(d) Improper adjustment of the drive pinion and the hypoid driven gear	Adjust.
	(e) Excessive backlash of a vehicle under severe operating conditions due to worn differential side gear, washer or differential pinion.	Add recommended oil to the specified level. Do not use vehicle under severe operating conditions.
	(f) Loose hypoid driven gear tightening bolts	Tighten.
<p>2. Differential and hypoid gear noises</p> <p>Troubles of the differential and hypoid gear always appear as noise problems. Therefore noise is the first indication of trouble. However, noises from the engine, muffler, tire, exhaust gas, bearing, body, etc. are easily mistaken for the differential noise. Pay special attention to the hypoid gear noise because it is easily confused with other gear noises. There are the following four kinds of noises.</p> <ul style="list-style-type: none"> <li>• Gear noise when driving: If noise increases as the vehicle speed increases, it may be due to insufficient gear oil, incorrect gear engagement, damaged gears, etc.</li> <li>• Gear noise when coasting: Damaged gears due to misadjusted bearings and incorrect shim adjustment.</li> <li>• Bearing noise when driving or coasting: Cracked, broken or damaged bearings</li> <li>• Noise mainly when turning: Noise from differential side gear, differential pinion or differential pinion shaft, etc.</li> </ul>	(a) Insufficient oil	Lubricate.
	(b) Improper adjustment of hypoid driven gear and drive pinion	Check the tooth contact.
	(c) Worn teeth of hypoid driven gear and drive pinion	Replace as a set. Readjust the bearing preload.
	(d) Loose roller bearing	Readjust the backlash of the hypoid driven gear to drive pinion, and check the tooth contact.
	(e) Distorted hypoid driven gear or differential case	Replace.
	(f) Worn washer and differential pinion shaft	Replace.

#### **C: CAUTION**

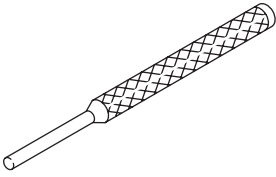

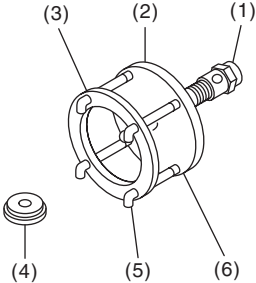

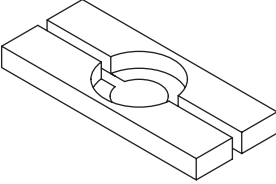

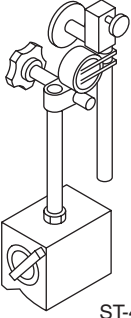

- Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
- Remove contamination including dirt and corrosion before removal, installation or disassembly.
- Keep the disassembled parts in order and protect them from dust and dirt.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- When disassembling the case and other light alloy parts, disassemble by using a plastic hammer. Do not pry apart with screwdrivers or other tools.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine transmission gear oil, grease or the equivalent. Do not mix transmission gear oil, grease etc. of different grades or manufacturers.
- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Apply transmission gear oil onto sliding or revolving surfaces before installation.
- Replace deformed or damaged snap rings with new parts.
- Before installing O-rings or oil seals, apply sufficient amount of transmission gear oil to avoid damage and deformation.
- Be careful not to incorrectly install or fail to install O-rings, snap rings and other parts.
- Before securing a part on a vise, place cushioning materials such as wood blocks, aluminum plates, or waste cloth between the part and the vise.
- Avoid damaging the mating surface of the case.
- Before applying liquid gasket, completely remove the old liquid gasket.

# General Diagnostic Table

MANUAL TRANSMISSION AND DIFFERENTIAL

## 24. General Diagnostic Table

### A: INSPECTION

#### 1. MANUAL TRANSMISSION

Symptom	Possible cause	Corrective action
1. Gears are difficult to engage <b>NOTE:</b> The cause for difficulty in shifting gears can be classified into two types: One is a defective gear shift system and the other is defective transmission. However, if the operation is heavy and engagement of the gears is difficult, a defective clutch function may also be responsible. Check whether the clutch is correctly functioning, before checking the gear shift system and transmission.	(a) Worn, damaged or burred chamfer at internal spline of the sleeve	Replace.
	(b) Gear spline wear, damage, dents	Replace.
	(c) Worn or scratched bushings	Replace.
	(d) Incorrect contact or wear between synchronizer ring and gear cone	Correct or replace.
2. Gear slip-out <ul style="list-style-type: none"> <li>• Gear slips out when coasting on rough road.</li> <li>• Gear slips out during acceleration.</li> </ul>	(a) Defective pitching stopper	Adjust.
	(b) Loose engine mounting bolts	Tighten or replace.
	(c) Worn fork shifter, broken shifter fork rail spring	Replace.
	(d) Worn or damaged ball bearing	Replace.
	(e) Large clearance between splines of synchronizer hub and synchronizer sleeve	Replace.
	(f) Worn in the synchronizer hub chamfer angle	Replace.
	(g) Worn 1st driven gear, needle bearing and race	Replace.
	(h) Worn 2nd driven gear, needle bearing and race	Replace.
	(i) Worn 3rd drive gear and bushing	Replace.
	(j) Worn 4th drive gear and bushing	Replace.
	(k) Worn 5th drive gear and bushing	Replace.
	(l) Worn 6th drive gear and bushing	Replace.
	(m) Worn reverse idler gear and bushing	Replace.
3. Noise emitted from transmission <b>NOTE:</b> If a noise is heard when the vehicle is parked with its engine idling and ceases when the clutch is disengaged, it may be considered that the noise is coming from the transmission.	(a) Insufficient or improper lubrication	Replenish or replace with the specified amount of recommended oil.
	(b) Worn or damaged gears and bearings <b>NOTE:</b> If the trouble is only wear of the gear teeth surfaces, only a high whirring noise will occur at high speeds, but if any part is broken, rhythmical clicking sounds will be heard even at low speeds.	Replace.

# General Diagnostic Table

## MANUAL TRANSMISSION AND DIFFERENTIAL

### 2. DIFFERENTIAL

Symptom	Possible cause	Corrective action
1. Broken differential (case, gear, bearing, etc.) <b>NOTE:</b> Noise will occur, and eventually the differential will not be able to operate due to broken pieces obstructing the gear revolution.	(a) Insufficient or improper oil	Disassemble the differential and replace broken components. At the same time check other components for any trouble, and replace if necessary.
	(b) Use of vehicle under severe conditions such as excessive load and improper use of the clutch	Readjust the preload and backlash of the bearing, and the contact surface of gear.
	(c) Improper adjustment of taper roller bearing	Adjust.
	(d) Improper adjustment of the drive pinion and the hypoid driven gear	Adjust.
	(e) Loose hypoid driven gear clump bolts	Tighten.
2. Differential and hypoid gear noises Troubles of the differential and hypoid gear always appear as noise problems. Therefore noise is the first indication of trouble. However, noises from the engine, muffler, tire, exhaust gas, bearing, body, etc. are easily mistaken for the differential noise. Pay special attention to the hypoid gear noise because it is easily confused with other gear noises. There are the following four kinds of noises. <ul style="list-style-type: none"> <li>• Gear noise when driving: If noise increases as the vehicle speed increases, it may be due to insufficient gear oil, incorrect gear engagement, damaged gears, etc.</li> <li>• Gear noise when coasting: Damaged gears due to misadjusted bearings and incorrect shim adjustment.</li> <li>• Bearing noise when driving or coasting: Cracked, broken or damaged bearings.</li> </ul>	(a) Insufficient oil	Replenish or replace with the specified amount of recommended oil.
	(b) Improper adjustment of hypoid driven gear and drive pinion	Check the tooth contact.
	(c) Worn teeth of hypoid driven gear and drive pinion	Replace as a set. Readjust the bearing preload.
	(d) Loose roller bearing	Readjust the backlash of the hypoid driven gear to drive pinion, and check the tooth contact.
	(e) Distorted hypoid driven gear or differential case	Replace.

- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine fluid, grease etc. or equivalent. Do not mix fluid, grease, etc. of different grades or manufacturers.
- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Apply grease onto sliding or revolving surfaces before installation.
- Before installing O-rings or snap rings, apply sufficient amount of fluid to avoid damage and deformation.
- Before securing a part in a vise, place cushioning material such as wood blocks, aluminum plate or cloth between the part and the vise.
- Keep fluids away from the vehicle body. If any fluid contacts the vehicle body, immediately flush the area with water.

## 12. General Diagnostic Table

### A: INSPECTION

#### 1. CLUTCH

Symptom	Possible cause	Corrective action
<p>1. Clutch slippage. It is hard to perceive clutch slippage in the early stage, but pay attention to the following symptoms.</p> <ul style="list-style-type: none"> <li>• Engine speeds up when shifting.</li> <li>• High-speed driving is not possible; especially rapid acceleration is not possible and vehicle speed does not increase in proportion to the increase in engine speed.</li> <li>• Power drops particularly when ascending a slope, and there is a burning smell of the clutch plate.</li> <li>• Method of testing: Park the vehicle and fully apply the parking brake. Disengage the clutch and shift the transmission gear into the 1st. Gradually increase the engine speed while gradually allowing the clutch to engage. The clutch function is satisfactory if the engine stalls. However, the clutch is slipping if the vehicle does not move forward and the engine does not stall.</li> </ul>	(a) Oil on the clutch face	Replace.
	(b) Worn clutch face	Replace.
	(c) Deteriorated diaphragm spring	Replace.
	(d) Warped pressure plate or flywheel	Correct or replace.
	(e) Defective release bearing holder	Correct or replace.
<p>2. Clutch drags. As a symptom of this trouble, a harsh scratching noise occurs and control becomes difficult when shifting gears. The symptom becomes more apparent when shifting into the 1st gear. However, because most trouble of this sort is due to a defective synchronization mechanism, perform the following tests. Method of testing: &lt;Ref. to CL-38, DIAGNOSTIC DIAGRAM OF CLUTCH DRAG, INSPECTION, General Diagnostic Table.&gt; The problem is caused by insufficient disengagement of the clutch if an abnormal noise occurs during this test.</p>	(a) Worn or rusty clutch disc hub spline	Replace the clutch disc.

	(c) Crankshaft pilot needle bearing sticking	Replace.

<p>3. Clutch chatters. Clutch chattering is an unpleasant vibration to the whole vehicle when the vehicle is just started with clutch partially engaged.</p>	(a) Adhesion of oil on the clutch face	Replace the clutch disc.
	(b) Weak or broken damper spring	Replace the clutch disc.
	(c) Poor contact of the disc surface or excessively worn disc	Replace the faulty clutch disc.

	(b) Deteriorated cushioning spring	Replace the clutch disc.
	(c) Worn or rusted spline of clutch disc or main shaft	Take off rust, apply grease or replace clutch disc or main shaft.

## 3. DIAGNOSTIC DIAGRAM OF CLUTCH DRAG

Step	Check	Yes	No
<b>1</b> <b>CHECK GEAR NOISE.</b> 1) Start the engine. 2) Disengage the clutch and shift quickly from neutral to reverse in idling condition.	Is there any abnormal noise from the transmission gear?	Go to step 2.	Clutch is normal.
<b>2</b> <b>CHECK GEAR NOISE.</b> Disengage the clutch at idle and shift from neutral to reverse within 0.5 — 1.0 seconds.	Is there any abnormal noise from the transmission gear?	Go to step 3.	Defective transmission or excessive clutch drag torque. Inspect Pilot bearing, clutch disc, transmission and clutch disc hub spline.
<b>3</b> <b>CHECK GEAR NOISE.</b> 1) Disengage the clutch at idle and shift from neutral to reverse within 0.5 — 1.0 seconds. 2) With the clutch disengaged, shift from neutral to reverse, reverse to neutral several times.	Is there any abnormal noise from the transmission gear?	Inadequate clutch disengage. Inspect the clutch disc, clutch cover, clutch release, and clutch pedal free play.	Clutch and fly-wheel seizure. Inspect the clutch disc and the spline of the clutch disc hub.

## 2. Wheel Alignment

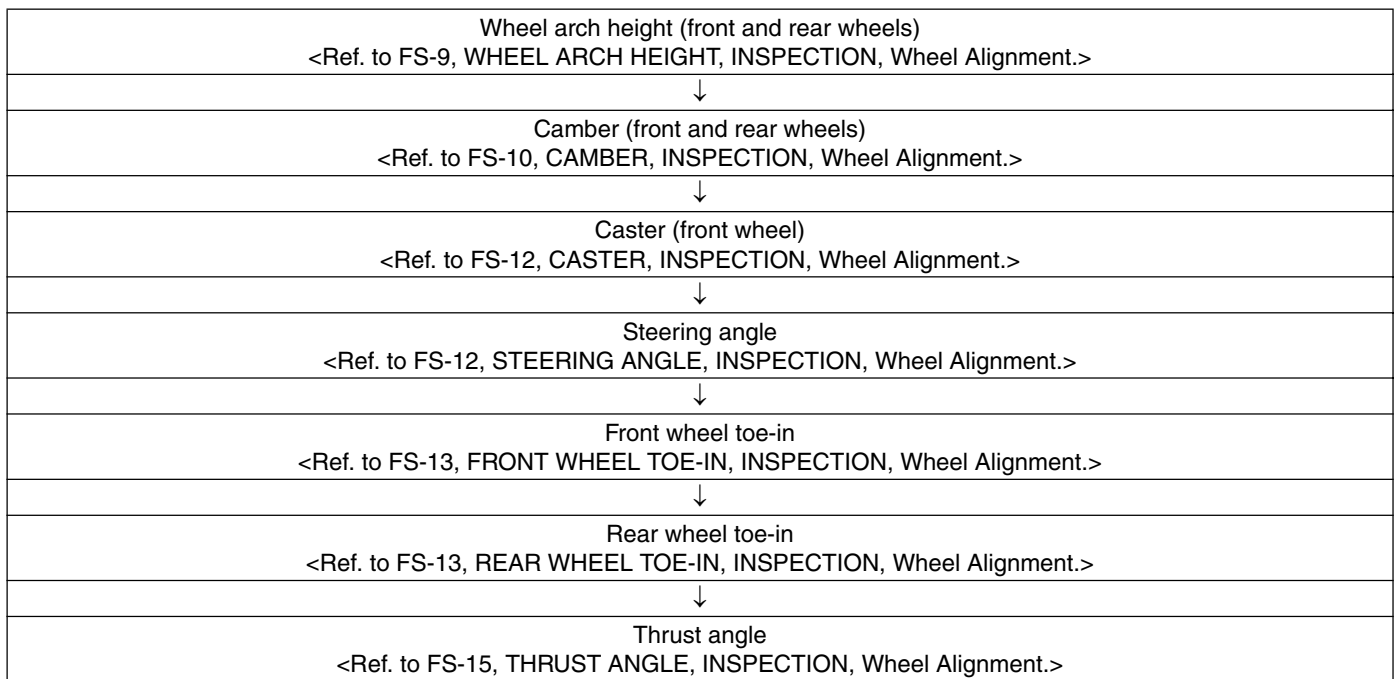

### A: INSPECTION

Check the following items before performing the wheel alignment measurement.

Check items before measuring wheel alignment:

- Tire inflation pressure
- Uneven wear of RH and LH tires, or difference of sizes
- Tire runout
- Excessive play and wear of ball joint
- Excessive play and wear of tie rod end
- Excessive play of wheel bearing
- Right and left wheel base imbalance
- Deformation and excessive play of steering link
- Deformation and excessive play of suspension parts

Check, adjust and measure the wheel alignment in accordance with the procedures indicated in the figure.

## 1. WHEEL ARCH HEIGHT

- 1) Park the vehicle on a level surface.
- 2) Empty the vehicle so that it is at “curb weight”. (Empty the luggage compartment, load the spare tire, jack and service tools, and fill up the fuel tank.)
- 3) Set the steering wheel in a straight-ahead position, and stabilize the suspensions by moving the vehicle in a straight line for 5 m (16 ft) or more.
- 4) Suspend a thread from the wheel arch (point “A” in the figure below) and affix at a position directly above the center of wheel.
- 5) Measure the distance between the point “A” and the center of wheel.

- |                       |                             |                          |

Measure the play as follows:

Fix the outer shell in place and fully extend the rod. Set a dial gauge at the end of rod L [10 mm (0.39 in)], and then read the dial gauge indication  $P_1$  while applying a force of W [20 N (2 kgf, 4 lb)] to the threaded portion. Apply a force of 20 N (2 kgf, 4 lb) from the opposite direction of "W", and then read the dial gauge indication  $P_2$ .

**Play limit ( $P_1 + P_2$ ):**  
**0.8 mm (0.031 in)**

If the play exceeds limit, replace the strut.

**2. STRUT MOUNT**

Check the rubber part for deformation, cracks or deterioration, and then replace it with a new part if defective.

**3. DUST COVER**

If major cracks or damage are found, replace it with a new part.

**4. COIL SPRING**

If a permanent strain is found, replaced it with a new part.

**5. HELPER**

If major cracks or damage are found, replace it with a new part.

### C: PREPARATION TOOL

#### 1. GENERAL TOOL

TOOL NAME	REMARKS
Air pressure gauge	Used for measuring tire air pressure.
Dial gauge with magnet stand	Used for measuring wheel runout.
Wheel balancer	Used for adjusting wheel balance.

## 2. Tire

### A: INSPECTION

1) Take stones, glass, nails etc. out of the tread groove.

2) Replace tires in the following cases.

#### CAUTION:

- When replacing a tire, make sure to use only tires of the same size, construction and load range as originally installed.
- Use a tire changer when removing the tire from the wheel.
- On models equipped with tire pressure monitoring systems, do not use the bead breaker in a 90° area centered on the transmitter to prevent damaging the transmitter.

- (1) Transmitter  
 (2) 90°  
 (use of a bead breaker is prohibited in this area.)

- To prevent damaging the transmitter, set the tire changer boom in the position as shown in the figure.

- (1) Transmitter  
 (2) Direction of turn table rotation  
 (3) 90°  
 (4) Tire changer boom

(1) If large cracks on side wall, damage or cracks on the tread is found.

(2) When the “tread wear indicator” appears as a solid band across the tread.

- (1) Tread wear indicator  
 (2) Tire tread

3) When a crack on tire valve is found, replace the tire valve.

### 1. TIRE ROTATION

Rotate tires periodically (12,500 km/7,500 miles) as shown in the figure, in order to prevent them from uneven wear and to prolong their life.

- Without instruction for the direction of tire rotation.

- (1) Front

- With instruction for the direction of tire rotation

### WHEEL AND TIRE SYSTEM

---

**NOTE:**

Vehicles equipped with tire pressure monitoring systems will require re-registration of transmitter ID. <Ref. to TPM(diag)-10, REGISTER TRANSMITTER ID, OPERATION, Subaru Select Monitor.>

## 3. Steel Wheel

### A: REMOVAL

- 1) Apply the parking brake, and position select lever to "P".
- 2) Set the shop jacks or a lift to the specified points, and support the vehicle with its wheels slightly contacting the floor.
- 3) Loosen the wheel nuts.
- 4) Raise the vehicle until its wheels are off the ground using the jack or a lift.
- 5) Remove the wheel nuts and wheels.

#### NOTE:

- When removing the wheels, be careful not to damage the hub bolts.
- Place the wheels with their outer sides facing upward to prevent wheels from being damaged.

### B: INSTALLATION

- 1) Remove dirt from the mating surface of the wheel and brake rotor.
- 2) Attach the wheel to the hub by aligning the wheel bolt holes with the hub bolts.
- 3) Temporarily attach the wheel nuts to the hub bolts. (In the case of aluminum wheels, use SUBARU genuine wheel nuts for aluminum wheels.)
- 4) Tighten the nuts by hand, making sure the wheel hub hole is aligned correctly to the guide portion of hub.
- 5) Tighten the wheel nuts in a diagonal selection to the specified torque. Use a wheel nut wrench.

#### Wheel nut tightening torque:

**120 N·m (12.2 kgf·m, 88.5 ft·lb)**

#### CAUTION:

- Tighten the wheel nuts in two or three steps by gradually increasing the torque on opposing nuts, until they reach the specified torque.
  - Do not push the wrench by foot. Always use both hands when tightening the nuts.
  - Make sure the bolt, nut and the nut seating surface of the wheel are free from oil.
- 6) If a wheel is removed for replacement or for repair of a puncture, retighten the wheel nuts to the specified torque after driving 1,000 km (600 miles).

### C: INSPECTION

- 1) Deformation or damage to the rim may cause air leakage. Check the rim flange for deformation, cracks or damage, and repair or replace as necessary.
- 2) Jack-up the vehicle until wheels clear the floor.
- 3) Slowly rotate the wheel to check rim "runout" using a dial gauge.

#### Rim runout:

Axial runout limit	Vertical run out limit
1.5 mm (0.059 in)	

- 4) If the rim runout exceeds specifications, remove the tire from the wheel and check runout with the dial gauge attached to positions shown in the figure.

(1) Approx. 7 mm (0.28 in)

- 5) If the measured runout still exceeds specifications, replace the wheel.

### 4. Aluminum Wheel

#### A: REMOVAL

Refer to “Steel Wheels” for removal procedure of aluminum wheels. <Ref. to WT-7, REMOVAL, Steel Wheel.>

#### B: INSTALLATION

Refer to “Steel Wheels” for installation procedure of aluminum wheels. <Ref. to WT-7, INSTALLATION, Steel Wheel.>

#### C: INSPECTION

Refer to “Steel Wheels” for inspection procedure of aluminum wheels. <Ref. to WT-7, INSPECTION, Steel Wheel.>

##### ***Rim runout:***

Axial runout limit	Vertical run out limit
1.0 mm (0.039 in)	

#### D: CAUTION

Aluminum wheels are easily scratched. To maintain their appearance and safety, be careful of the following:

- 1) Do not damage the aluminum wheels during removal, installation, wheel balancing, etc. After removing aluminum wheels, place them on a rubber mat etc.
- 2) When washing the aluminum wheel, use neutral synthetic detergent and water. Avoid using cleansers containing abrasives, hard brushes or an automatic car washer.

## 5. Wheel Balancing

### A: ADJUSTMENT

**NOTE:**

Because an adhesive type weight is adopted for the outside balance weight of 17-inch and 18-inch wheels, change the setting of the wheel balancer to adhesive type weight.

1) Remove the balance weights.

**CAUTION:**

- Be careful not to damage the wheel.
- Completely remove the double-sided tape of the adhesive weight from the wheel.

2) Using the wheel balancer, measure wheel balance.

3) Select a weight close to the value measured by wheel balancer.

**CAUTION:**

**Use SUBARU genuine balance weights.**

# General Description

## TIRE PRESSURE MONITORING SYSTEM (DIAGNOSTICS)

### 2. General Description

#### A: CAUTION

##### 1. SUPPLEMENTAL RESTRAINT SYSTEM “AIRBAG”

Airbag system wiring harness is routed near the TPM control module.

##### CAUTION:

- All airbag system wiring harnesses are yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the tire pressure monitoring control module.

##### 2. TIRE PRESSURE MONITORING CONTROL MODULE

- If the transmitter is replaced, ID registration for the transmitter is required. <Ref. to TPM(diag)-10, REGISTER TRANSMITTER ID, OPERATION, Subaru Select Monitor.>
- When adjusting tire pressure indoors in winter, there is a big temperature difference between the indoor facilities and outside. Once the car is outside where the temperature is lower, the air pressure in the tires will drop, causing the tire pressure warning light to illuminate, even if the pressure in the tires was adjusted to standard values indoors. To avoid this, it is necessary to adjust the tire pressure to the high side in consideration of the difference in temperature between inside and outside according to the following table.

a. 215/45ZR17

Temperature °C (°F)	Indoor temperature	15.5 (60)		
	Ambient temperature	-1 (30)	-12 (10)	-23 (-10)
Air pressure kPa (psi)	Front	265 (38)	280 (40)	295 (42)
	Rear	250 (36)	265 (38)	280 (40)

b. 215/45R18 and P215/45R18, P205/50R17

Temperature °C (°F)	Indoor temperature	15.5 (60)		
	Ambient temperature	-1 (30)	-12 (10)	-23 (-10)
Air pressure kPa (psi)	Front	250 (36)	265 (38)	280 (40)
	Rear	240 (35)	255 (37)	270 (39)

c. P225/60R16 and P225/55R17

Temperature °C (°F)	Indoor temperature	15.5 (60)		
	Ambient temperature	-1 (30)	-12 (10)	-23 (-10)
Air pressure kPa (psi)	Front	240 (35)	255 (37)	270 (39)
	Rear	230 (33)	245 (35)	260 (37)

#### B: INSPECTION

Before performing diagnosis, check the following item which might affect the quality of the tire pressure monitoring system.

##### 1. TIRE

- Inspect that the tire pressure is within the specification while the tire is cool. (Refer to Tire Caution Label.)
- Check the tires for damage or the insertion of foreign matters.

##### 2. BATTERY

Check that amount of battery fluid, gravity and voltage are within the specifications.

**Standard voltage: 12 V or more**

**Specific gravity: 1.260 or more**

## E: INSPECTION

Wash all the disassembled parts clean, and examine them for wear, damage and other defects. Repair or replace the defective parts as necessary.

- 1) Hypoid driven gear and drive pinion
  - If there is evidently an abnormal tooth contact, find out the cause and adjust until the teeth contact correctly. Replace the gear if there is an excessive worn or an incapable adjustment.
  - If crack, cutout or seizure is found, replace the parts as a set. Slight damage of some teeth can be corrected by oil stone or the like.
- 2) Side gear and pinion mate gear
  - Replace if cracks, scoring or other defects are evident on the tooth surface.
  - Replace if thrust washer contact surface is worn or seized. Slight damages of the surface can be corrected by oil stones or equivalent.

3) Bearing  
 Replace if seizure, peeling, wear, rust, dragging during rotation, noise or other defect is evident.

4) Thrust washer of the side gear and pinion mate gear:

Replace if seized, flawed, abnormally worn or having other defects.

5) Oil seal  
 Replace if deformed or damaged, and at every disassembling.

6) Differential carrier  
 Replace if the bearing bores are worn or damaged.

7) Differential case  
 Replace if its sliding surfaces are worn or cracked.

8) Companion flange  
 Replace if the oil seal lip contact surface shows cracking.

### 1. SIDE GEAR BACKLASH

Using a dial gauge, check the backlash of side gear. (Model without LSD)

**Side gear backlash:**

**GT spec. B 6MT model**

**27.0 — 54.0 N (2.8 — 5.5 kgf, 6.1 — 12.1 lb)**

If the total preload is not within the specification, adjust the side bearing retainer shims.

### 6. COMPANION FLANGE

1) If rust or dirt is attached to the companion flange, remove them.

2) Set a dial gauge at a companion flange surface (mating surface of propeller shaft and companion flange), and then measure the companion flange runout.

**Limit of runout:**

**0.08 mm (0.003 in)**

3) Set the gauge inside of the companion flange, and measure the runout.

**Limit of runout:**

Corrective action: Increase thickness of the pinion height adjusting washer according to the procedures for moving the drive pinion closer to the hypoid driven gear.

19) If proper tooth contact is not obtained, once again adjust the drive pinion height and the differential side bearing preload (already mentioned) and the hypoid gear backlash.

20) Install the new gasket and rear cover to the differential carrier, and tighten the bolts to specified torque.

**Tightening torque:**

## DIFFERENTIALS

### E: INSPECTION

Wash all the disassembled parts clean, and examine them for wear, damage or other defects. Repair or replace the defective parts as necessary.

#### 1) Hypoid driven gear and drive pinion

- If there is evidently an abnormal tooth contact, find out the cause and adjust until the teeth contact correctly. Replace the gear if there is an excessive worn or an incapable adjustment.

- If crack, cutout or seizure is found, replace the parts as a set. Slight damage of some teeth can be corrected by oil stone or the like.

#### 2) Side gear and pinion mate gear

- Replace if cracks, scoring or other defects are evident on the tooth surface.

- Replace if thrust washer contact surface is worn or seized. Slight damages of the surface can be corrected by oil stones or equivalent.

#### 3) Bearing

Replace if seizure, peeling, wear, rust, dragging during rotation, noise or other defect is evident.

#### 4) Thrust washer of the side gear and pinion mate gear:

Replace if seized, flawed, abnormally worn or having other defects.

#### 5) Oil seal

Replace if deformed or damaged, and at every disassembling.

#### 6) Differential carrier

Replace if the bearing bores are worn or damaged.

#### 7) Differential case

Replace if its sliding surfaces are worn or cracked.

#### 8) Companion flange

Replace if the oil seal lip contact surface shows cracking.

### 1. SIDE GEAR BACKLASH

Using a dial gauge, check the backlash of side gear. (VA1-type only)

#### *Side gear backlash:*

**0.05 — 0.15 mm (0.002 — 0.006 in)**

If the side gear backlash is not within the specification, select the side gear thrust washer and adjust the side gear backlash as specified.

### 2. HYPOID DRIVEN GEAR BACKLASH

Using a dial gauge, check the backlash of hypoid driven gear.

#### *Hypoid driven gear backlash:*

**0.10 — 0.15 mm (0.004 — 0.006 in)**

If the hypoid driven gear backlash is not within the specification, adjust the side bearing preload or repair if necessary.

### 3. TOOTH CONTACT BETWEEN HYPOID DRIVEN GEAR AND DRIVE PINION

Inspect the tooth contact between the hypoid driven gear and drive pinion. <Ref. to DI-69, ASSEMBLY, Rear Differential (VA-type).>

#### 4. COMPANION FLANGE

- 1) If rust or dirt is attached to the companion flange, remove them.
- 2) Set a dial gauge at a companion flange surface (mating surface of propeller shaft and companion flange), and then measure the companion flange runout.

**Limit of runout:**

**0.08 mm (0.003 in)**

- 3) Set the gauge inside of the companion flange, and measure the runout.

**Limit of runout:**

**0.08 mm (0.003 in)**

- 4) If either runout exceeds the limit, move the phase of companion flange and drive pinion 90° each, and find the point where the runout is within the limit.
- 5) If the runout exceeds the limit even after changing the phase, replace the companion flange and recheck the runout.
- 6) If the runout exceeds the limit after replacing the companion flange, the drive pinion may be assembled incorrectly or bearing is faulty.

#### F: ADJUSTMENT

##### 1. SIDE GEAR BACKLASH

Adjust the side gear backlash. (VA1-type)  
 <Ref. to DI-69, ASSEMBLY, Rear Differential (VA-type).>

##### 2. HYPOID DRIVEN GEAR BACKLASH

#### A: REMOVAL

##### NOTE:

- Before removing propeller shaft, wrap metal parts with a cloth or rubber material.
- In case of a EDJ type, wrap the metal parts at the rubber boot of EDJ with a cloth or rubber material before removing propeller shaft, as shown in the figure. The rubber boot may be damaged due to interference with adjacent metal parts while bending the EDJ during removal.

- 1) Disconnect the ground cable from the battery.
- 2) Shift the select lever or gear shift lever to neutral.
- 3) Release the parking brake.
- 4) Lift up the vehicle.
- 5) Remove the center exhaust pipe.
- 6) Remove the rear exhaust pipe and muffler.
- 7) Remove the heat shield cover.

- 9) Remove the three bolts holding the propeller shaft to the rear differential.
- 10) Remove the remaining bolt.
- 11) Remove the two bolts which hold center bearing to vehicle body.

- 12) Remove the propeller shaft from transmission.

##### CAUTION:

- Be careful not to damage oil seals and frictional surface of the sleeve yoke.
- Cover the center exhaust pipe with a cloth to keep off any ATF or oil spilled from transmission when removing propeller shaft.

##### NOTE:

Use a container to catch ATF or oil flowing from propeller shaft.

13) Install an extension cap to the transmission.

**NOTE:**

If extension cap is not available, place vinyl bag over opening and fasten with string to prevent gear oil or ATF from leaking.

3) Install the heat shield cover.

4) Install the center exhaust pipe.

### C: INSPECTION

#### NOTE:

Do not disassemble propeller shaft. Check the following and replace if necessary.

- Tube surface for dents or cracks
- Splines for deformation or abnormal wear
- Unsmooth joint operation or abnormal noise
- Center bearing for free play, noise or non-smooth operation.
- Oil seals for abnormal wear or damage
- Damaged center bearing

Check the following points with propeller shaft installed in vehicle.

#### 1. JOINTS AND CONNECTIONS

- 1) Remove the center exhaust pipe.
- 2) Remove the heat shield cover.
- 3) Check for any looseness of the yoke flange mounting bolts which connect to the rear differential and center bearing bracket mounting bolts.

#### 2. SPLINES AND BEARING

## 2. CHECKING THE HYDRAULIC UNIT ABS OPERATION WITH THE BRAKE TESTER

1) Install the spare fuse to the FWD connector located in the main fuse box for models without AT VTD.

- (1) Main fuse box
- (2) FWD connector

2) Since the MT model and AT VTD model cannot cut off the AWD circuit, set the wheels other than the measured one on free rollers.

3) Prepare for ABS sequence control.

<Ref. to ABS-10, ABS Sequence Control.>

4) Set the front wheels or rear wheels on the brake tester and set the gear to "neutral".

- (1) Brake tester

## D: REPLACEMENT

### CAUTION:

- Because the seal of the ABSCM cannot be replaced, do not pull or peel it by lifting it up.
- Because the screw of the H/U will become slightly worn in every replacement procedure, 5 times is the maximum number of times for replacement. If a problem is found such as not being able to torque the screw to specifications even before 5 replacement operations are performed, replace the H/U body.
- When installing the ABSCM, always use new screws.
- When the sealing surface of the ABSCM or H/U is dirty or damaged and it cannot be removed or repaired, replace with a new part.

1) Remove the ABSCM&H/U bracket. <Ref. to ABS-6, REMOVAL, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).>

2) To prevent entry of foreign objects and brake fluid leakage, plug the oil pressure port of the ABSCM&H/U using a screw plug, etc.

3) Set the pump motor section of the removed AB-SCM&H/U face down on a vise.

**NOTE:**

Before securing a part in a vise, place cushioning material such as wood blocks, aluminum plate or cloth between the part and the vise.

- (1) Aluminum plate, etc.
- (2) Vise

4) Using TORX® bit E5, remove the four screws of ABSCM.

**NOTE:**

These screws cannot be reused.

5) Slowly pull out the ABSCM upward from the H/U.

**NOTE:**

To prevent damaging of coil section, remove the ABSCM straight up from H/U without twisting.

6) Make sure there is no dirt or damage on the sealing surface of the H/U.

**CAUTION:**

- Do not clean the ABSCM and H/U by applying compressed air.
- Even if damage is found on the H/U seal, do not attempt repair by filing or with a metal scraper. To remove the seal residue, always use a plastic scraper. Do not use chemical such as paint thinner, etc., to clean.

7) Position the coil of the new ABSCM to align with the H/U valve.

8) To prevent deformation of the ABSCM housing cover, hold the corner of ABSCM and install it to the H/U without tilting.

9) Using a TORX® bit E5, attach/tighten new screws in the order of (1) through (4).

**CAUTION:**

**Always use new screws.**

**Tightening torque:**

**1.5 N·m (0.15 kgf·m, 1.1 ft-lb)**

10) Check that there is no foreign matter in mating surface between the ABSCM and H/U.

11) Using a TORX® bit E5, tighten the screws in the order of (1) through (4) again.

**Tightening torque:**

**3 N·m (0.3 kgf·m, 2.2 ft-lb)**

12) Check that there is no gap in the mating surface between ABSCM and H/U.

13) Install the ABSCM&H/U to the vehicle.

## D: REPLACEMENT

### CAUTION:

- Because the pressure sensor built into the H/U is easily damaged by static electricity, start the operation after performing static electricity measures.

- Be careful not to touch the sensors in the H/U to prevent damage.

- Because the seal of the VDCCM cannot be replaced, do not pull or peel it by lifting it up.

- Because the screw of the H/U will become slightly worn in every replacement procedure, 5 times is the maximum number of times for replacement. If a problem is found such as not being able to torque the screw to specifications even before 5 replacement operations are performed, replace the H/U body.

- When installing the VDCCM, always use new screws.

- When the sealing surface of the VDCCM or H/U is dirty or damaged and it cannot be cleaned or repaired, replace with a new part.

1) Remove the VDCCM&H/U. <Ref. to VDC-7, REMOVAL, VDC Control Module and Hydraulic Control Unit (VDCCM&H/U).>

2) To prevent entry of foreign objects and brake fluid leakage, plug the oil pressure port of the VDCCM&H/U using a screw plug, etc.

3) Set the pump motor section of the removed VDCCM&H/U face down on a vise.

### NOTE:

Before securing a part in a vise, place cushioning material such as wood blocks, aluminum plate or cloth between the part and the vise.

(1) Aluminum plate, etc.

(2) Vise

4) Using TORX® bit E5, remove the four screws of VDCCM.

### NOTE:

These screws cannot be reused.

5) Slowly pull out the VDCCM upward from the H/U.

### NOTE:

To prevent damaging of coil section, remove the VDCCM straight up from H/U without twisting.

6) Make sure there is no dirt or damage on the sealing surface of the H/U.

### CAUTION:

- Do not clean the VDCCM&H/U by applying compressed air.

- Even if damage is found on the H/U seal, do not attempt repair by filing or with a metal scraper. To remove the seal residue, always use a plastic scraper. Do not use chemical such as paint thinner, etc., to clean.

7) Position the coil of the new VDCCM to align with the H/U valve.

8) To prevent deformation of the VDCCM housing cover, hold the corner of VDCCM and install it to the H/U without tilting.

9) Using a TORX<sup>®</sup> bit E5, attach/tighten new screws in the order of (1) through (4).

**CAUTION:**

**Always use new screws.**

**Tightening torque:**

**1.5 N·m (0.15 kgf·m, 1.1 ft·lb)**

10) Check that there is no foreign matter in mating surface between the VDCCM&H/U.

11) Using a TORX<sup>®</sup> bit E5, tighten the screws in the order of (1) through (4) again.

**Tightening torque:**

**3 N·m (0.3 kgf·m, 2.2 ft·lb)**

12) Check that there is no gap in the mating surface between VDCCM&H/U.

13) Install the VDCCM&H/U to the vehicle.

14) Bleed air from the brake system.

15) Perform the selection and registration operation of parameter. <Ref. to VDC(diag)-17, PARAMETER SELECTION, OPERATION, Subaru Select Monitor.>

**NOTE:**

- After replacing the VDCCM, be sure to perform the selection and registration operation of parameter.

- For the selection and registration of parameter, the Subaru Select Monitor is required.

- When no data is registered, ABS/EBD/VDC warning light illuminates and the DTC “Parameter selection failure” is detected.

16) Check the parameter to confirm that the applied models and grades of the relevant vehicle are included. <Ref. to VDC(diag)-17, PARAMETER CHECK, OPERATION, Subaru Select Monitor.>

17) If the applied models and grades of the relevant vehicle are not included, perform the selection and registration operation of parameter with the {Confirm Parameter} screen again. <Ref. to VDC(diag)-17, PARAMETER SELECTION, OPERATION, Subaru Select Monitor.>

18) Execute Clear Memory after parameter selection and registration operations because the DTC for “Parameter selection failure” is memorized.

## E: ADJUSTMENT

When the following replacement, removal and installation are performed, be sure to perform the centering of the steering angle sensor and zero point setting of yaw rate & lateral G sensor.

- VDCCM&H/U
- Steering angle sensor
- Yaw rate & lateral G sensor
- Steering wheel parts (Including airbag)
- Suspension parts
- Wheel alignment adjustment

2) Check that steering wheel is positioned at the center. (When the center position is not correct, adjust the wheel alignment.)

3) Set the Subaru Select Monitor to the vehicle, and select {Set up mode for Neutral of Steering Angle Sensor & Lateral G Sensor 0 point} in the “Function check sequence” screen. (Follow the steps on the display.)

4) On the “Brake Control System” display screen, select {Current Data Display & Save}, and check that the steering angle sensor shows “0 deg”.

5) When the “0 deg” is not displayed, repeat the above steps and check that the “0 deg” is displayed.

6) Drive the vehicle for 10 minutes, and check that the ABS and VDC warning light is not illuminated.

7) Check that there is no unnecessary VDC operation or steering control loss. If there is a problem, repeat the steps above.

1) When warning lights or indicator lights do not illuminate in accordance with this illumination pattern, there must be an electrical malfunction.

2) When warning lights or indicator lights remain constantly OFF, check the combination meter circuit or CAN communication circuit. <Ref. to VDC(diag)-26, VDC WARNING LIGHT, VDC OFF INDICATOR LIGHT AND VDC INDICATOR LIGHT DO NOT COME ON, Warning Light Illumination Pattern.>

3) When ABS warning light does not go off, check the combination meter circuit. <Ref. to VDC(diag)-29, ABS WARNING LIGHT DOES NOT GO OFF, Warning Light Illumination Pattern.>

4) When the VDC indicator light, VDC warning light and VDC OFF indicator light do not go off, check the combination meter circuit or CAN communication circuit. <Ref. to VDC(diag)-30, VDC INDICATOR LIGHT DOES NOT GO OFF, Warning Light Illumination Pattern.>

## NOTE:

- Even though the ABS warning light does not go off after 2 seconds from ABS warning light illumination, the ABS system operates normally when the warning light goes off while driving at approximately 12 km/h (7 MPH). However, the ABS system does not work while the ABS warning light is illuminated.
- It may take several minutes before VDC warning light and VDC OFF indicator light goes off if the vehicle is parked under low temperature for a specified time. This is not defective because it is resulted from low engine coolant temperature.
- With the vehicle jack-up/lift-up or set on free rollers, when the wheels lock or spin after starting the engine, ABS warning light, VDC warning light and VDC OFF indicator light may illuminate because VDCCM&H/U detects the abnormal conditions from ABS wheel speed sensors. In this case, this is not a malfunction. Perform the Clear Memory Mode.
